**DAILY NEWS**

**Major leap for faster computers**  
Super-fast quantum computers are now a step closer to becoming a reality, thanks to a new breakthrough.  
*Edinburgh and Manchester University researchers have created a molecular device which could act as a building block for super-fast computers. They have created components that could be used to develop quantum computers, which can make intricate calculations faster than conventional machines.*  
*The academics used molecular scale technology instead of silicon chips.*  
*They achieved the breakthrough by combining tiny magnets with molecular machines that can shuttle between two locations without the use of external force.*
